

Natures Answer to Chemo?

MAXIMIZE Graviola750

Graviola is fast becoming a well known Amazonian Rainforest herb, and has attracted worldwide interest as a cancer treatment. It has been used in alternative cancer clinics for over 25 years, and likely due to its word of mouth success, it has more recently been under investigation by such organizations as the National Cancer Institute and the National Institute of Health.

Graviola has been studied in more than 20 laboratory tests since the 1970s, and has been shown to effectively target and kill malignant cells in 12 different types of cancer, including colon, breast, prostate, lung, and pancreatic cancer.

Graviola is a small tree with large dark green leaves which produces a fruit the size of a large cantaloupe with a delicious white flesh. The leaf of the Graviola tree has been proven to have unique properties that assist the immune system in cleaning abnormal tissue growth. Various research, including studies conducted by the National Cancer Institute, reveal that it contains natural compounds shown to have exceptional cytotoxic activity, which amounts to the ability of the prevention of abnormal cellular division.

A set of phytochemicals called annonaceous acetogenins which may be unique to this plant have been documented, and in fact patented as anti-tumor agents. Currently under study at Purdue University in conjunction with the National Institute of health, at least 9 patents have been filed on their work around antitumorous and antimicrobial uses of these acetogenins.

One study demonstrated that an acetogenin in Graviola was 10,000 times the potency of adriamycin (a chemotherapy drug.) Reportedly, it only seeks out the bad cells and destroys them, leaving the good cells. It is not an absurd possibility that this remarkable healing tree could change the face of cancer.
